Best foot forward

-new **Non-metallic Safety Footwear** from Kem Edwards Ltd.

Kem Edwards Ltd., suppliers to the construction services industry nationwide, has launched a new range of non-metallic safety footwear. Not only are they lighter and more flexible than traditional metal soled boots, but they increase insulation properties for the wearers.

The boots are already being supplied to BAA's First and Second Tier Suppliers, where they are making an active contribution to security and saving many hours of time for the workers on the project who need to pass regularly through detection equipment.

Conforming to EN345, the new footwear comes in a variety of styles, including shoes, ankle boots, chukka boots and riggers boots in unisex sizes 3-13. The midsole protection is extended to cover the total foot length for added safety and the sole is resistant to acids, oils, alkalis and heat to 200°C.

Richard Edwards, Managing Director of Kem Edwards, said; "New high performance materials have made non-metallic safety footwear a viable alternative to traditional styles. They are great to wear for long periods as they are much lighter, plus you don't have take them off and on if passing through metal detection systems!"

With 200 joule toe protection and additional scuff cover, the safety footwear is up to the toughest of tasks and has good insulation properties for additional comfort.

Kem Edwards' full product range includes 15,000 stock lines covering fixings, site equipment, mechanical and electrical components, tools, personal protection equipment and general site supplies. High profile projects for the company have included the Millennium Dome, Heathrow's Terminal 5, redevelopment of Canary Wharf and Wembley Stadium plus many other public sector buildings.
